

Annual meeting confirmation Form

The doctoral committee and the PhD student have met for second annual meeting and discussed the progress of the PhD study based on the student's self-assessment.

Date of the annual meeting (dd. mm. yyyy): 09. 06. 2026

Name of doctoral student: Zenabu Suboi

Name of Supervisor: Prof. Dr. Christian Lengeler

Name of other member(s) of the doctoral committee present at the annual meeting:

Dr. Emilie Pothin, Dr. Christian Selinger, PD Dr. Amanda Ross

At the first meeting of the doctoral committee it has been

agreed

disagreed

with the student to continue the PhD study

Student Signature:

, 11.06.2026

Supervisor Signature:

Christian
Lengeler

Digitally signed by
Christian Lengeler
Date: 2026.06.11

Meeting sheet no. 2

Date: June, 9th 2026

Name: Zenabu Suboi

Matriculation number: 23-068-638

A Doctoral Committee meeting takes place at least once per year.

Participants: First Supervisor, Second Supervisor and Doctoral Candidate.

The meeting serves to review the Doctoral Agreement, to assess the current status of the thesis and to agree on future objectives. Part of the meeting should be used for one-to-one discussions (Second Supervisor and Doctoral Candidate as well as Second Supervisor and First Supervisor).

The completed meeting sheets remain with the Doctoral Candidate (with copy to First Supervisor) and must be submitted in original to the Dean's Office at the initiation of the Doctoral Degree Procedure.

Status review meeting (including objectives and deadlines)

Zenabu Suboi gave a detailed presentation of her work accomplished during year 2. As initial technical work performed during year 1 (emulator training, sensitivity analysis) has been paused, objective 1 has changed to quantifying the community protection of insecticide-treated nets.

Objective 2 is centered around the question to identify drivers of intervention prioritization. Objective 3 is about improving parameter inference. Work accomplished during year 1 will be used to achieve objectives 2 & 3.

For objective 1, Zenabu presented a brief literature review as well experimental and modeling evidence of community protection and highlighted that her PhD work will fill important knowledge gaps to better understand whether variability in transmission intensity and effective usage have epidemiological implications. Her detailed results highlighted that community protection is plateauing at effective coverage rates between 50-80%, depending on transmission intensity. The work from objective 1 is already documented as a manuscript currently revised internally which should be finalized for submission by August 2026. Some figures (effects in users vs. non-users) have spurred discussion about the interpretation of figures, and good advice has been given by members of the committee.

For objective 2, a suitable simulation database has been created which Zenabu will be analyzing using statistical and sensitivity analysis approaches. We anticipate that this work will be accomplished by March 2027, when Zenabu will come back from Ghana to Switzerland.

For objective 3, extensive work on emulators from year 1 will be applied to Bayesian inference applied to epidemiological data from Ghana at the sub-national level. This objective should be accomplished during her last stay in Switzerland, March-June 2027.
