

Annual meeting confirmation Form

The doctoral committee and the PhD student have met for first annual meeting and discussed the progress of the PhD study based on the student's self-assessment.

Date of the annual meeting (dd. mm. yyyy): 11. 06. 2025

Name of doctoral student: Zenabu Suboi

Name of Supervisor: Prof. Dr. Christian Lengeler

Name of other member(s) of the doctoral committee present at the annual meeting:

Dr. Emilie Pothin, Dr. Christian Selinger, PD Dr. Amanda Ross

At the first meeting of the doctoral committee it has been

agreed

disagreed

with the student to continue the PhD study

Student Signature:

Supervisor Signature:

Meeting sheet no. 1

Date: June 11, 2025

Name: Zenabu Suboi

Matriculation number: 23-068-638

A Doctoral Committee meeting takes place at least once per year.

Participants: First Supervisor, Second Supervisor and Doctoral Candidate.

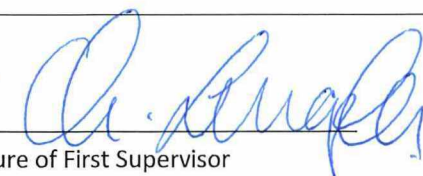

The meeting serves to review the Doctoral Agreement, to assess the current status of the thesis and to agree on future objectives. Part of the meeting should be used for one-to-one discussions (Second Supervisor and Doctoral Candidate as well as Second Supervisor and First Supervisor).

The completed meeting sheets remain with the Doctoral Candidate (with copy to First Supervisor) and must be submitted in original to the Dean's Office at the initiation of the Doctoral Degree Procedure.

Status review meeting (including objectives and deadlines)

Zenabu Suboi has provided a thorough presentation of her PhD work during the first year. She gave an outline with the main objectives and provided detailed updates on objective 1, i.e. forward propagation of uncertainty for a malaria model in Ghana at the district level. Interestingly, the relative impact of malaria interventions depends on the geographic context, but also whether other interventions are co-deployed. Zenabu also provided updates on the implementation of Gaussian emulators which help to overcome hurdles of computational burden. The results on the sensitivity analysis with four key interventions (SMC, IRS, LLIN, vaccine) provided new insights in how impact metrics depend on variability in coverage levels. It was noted by several committee members that such results are challenging to communicate with policy makers. Instead, it was suggested to consider the effect of community-level protection to avert infections by using existing simulation results. This discussion should help to further shape ongoing manuscript writing for objective 1.

Overall, progress by Zenabu has been impressive. Besides her PhD work, it should be stressed that she has also completed almost all of her required course work. During the summer, she will participate in two modeling courses, both as student and as a lecturer.
